Advanced Frontend Optimization Tracks

HIGH-VALUE TIER GUIDE

1. CORE METRICS: THE 3 HS OF LLM ALIGNMENT

Reinforcement Learning from Human Feedback (RLHF) shifts basic annotators into evaluative judges. Instead of creating simple tags, specialists rate side-by-side model predictions based on the 3 Hs framework:

THE DIMENSION	CORE EVALUATION DEFINITION	CRITICAL FAILURE MODE
Truthfulness	Total freedom from logical contradictions, hallucinations, or obsolete fabrications.	Confidently stating incorrect data as real.
Helpfulness	Following the prompt intent cleanly, using rich structuring, and fulfilling parameters.	Giving brief, evasive, or uninformative text.
Harmlessness	Active avoidance of toxic programming, dangerous recipes, malware assistance, or systemic bias.	Generating step-by-step malicious tutorials.

2. FORMULATING ENGINEERING JUSTIFICATIONS

Premium platforms require human evaluators to provide detailed analytical written statements explaining exactly *why* Model A outperformed Model B. Short personal notes like "Model A felt better" fail quality checks instantly.

Gold Standard Justification Blueprint

"Model A is significantly preferred over Model B due to clear adherence to structural limitations and absolute Truthfulness. While the prompt explicitly requested a maximum of two paragraphs, Model B generated four paragraphs (violating constraints) and introduced a clear logical hallucination in sentence 3 regarding state hooks. Conversely, Model A followed formatting specifications, remained factually verified, and maintained a highly technical yet accessible tone."
